## Pearson Edexcel International Advanced Level

**Friday 12 January 2024**

Afternoon (Time: 1 hour 30 minutes)

Paper  
reference

**WST02/01**

### Mathematics

#### International Advanced Subsidiary/Advanced Level Statistics S2

#### You must have:

Mathematical Formulae and Statistical Tables (Yellow), calculator

Total Marks

**Candidates may use any calculator permitted by Pearson regulations.  
Calculators must not have the facility for symbolic algebra manipulation,  
differentiation and integration, or have retrievable mathematical formulae  
stored in them.**

#### Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided
  - *there may be more space than you need.*
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Values from the statistical tables should be quoted in full. If a calculator is used instead of the tables, the value should be given to an equivalent degree of accuracy.
- Inexact answers should be given to three significant figures unless otherwise stated.

#### Information

- A booklet 'Mathematical Formulae and Statistical Tables' is provided.
- There are 7 questions in this question paper. The total mark for this paper is 75.
- The marks for **each** question are shown in brackets
  - *use this as a guide as to how much time to spend on each question.*

#### Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- If you change your mind about an answer, cross it out and put your new answer and any working underneath.

**Pearson**

1. The manager of a supermarket is investigating the number of complaints per day received from customers.

A random sample of 180 days is taken and the results are shown in the table below.

Number of complaints per day	0	1	2	3	4	5	6	$\geq 7$
Frequency	12	28	37	38	29	17	19	0

- (a) Calculate the mean and the variance of these data.

(3)

- (b) Explain why the results in part (a) suggest that a Poisson distribution may be a suitable model for the number of complaints per day.

(1)

The manager uses a Poisson distribution with mean 3 to model the number of complaints per day.

- (c) For a randomly selected day find, using the manager's model, the probability that there are

(i) at least 3 complaints,

(ii) more than 4 complaints but less than 8 complaints.

(4)

A week consists of 7 consecutive days.

- (d) Using the manager's model and a suitable approximation, show that the probability that there are less than 19 complaints in a randomly selected week is 0.29 to 2 decimal places.

Show your working clearly.

*(Solutions relying on calculator technology are not acceptable.)*

(5)

A period of 13 weeks is selected at random.

- (e) Find the probability that in this period there are exactly 5 weeks that have less than 19 complaints.

Show your working clearly.

2. The length of pregnancy for a randomly selected pregnant sheep is  $D$  days where

$$D \sim N(112.4, \sigma^2)$$

Given that 5% of pregnant sheep have a length of pregnancy of less than 108 days,

- (a) find the value of  $\sigma$  (3)

Qiang selects 25 pregnant sheep at random from a large flock.

- (b) Find the probability that more than 3 of these pregnant sheep have a length of pregnancy of less than 108 days. (2)

Charlie takes 200 random samples of 25 pregnant sheep.

- (c) Use a Poisson approximation to estimate the probability that at least 2 of the samples have more than 3 pregnant sheep with a length of pregnancy of less than 108 days. (3)

3. Rowan believes that 35% of type *A* vacuum tubes shatter when exposed to alternating high and low temperatures.

Rowan takes a random sample of 15 of these type *A* vacuum tubes and uses a two-tailed test, at the 5% level of significance, to test his belief.

- (a) Give **two** assumptions, in context, that Rowan needs to make for a binomial distribution to be a suitable model for the number of these type *A* vacuum tubes that shatter when exposed to alternating high and low temperatures.

(2)

- (b) Using a binomial distribution, find the critical region for the test.

You should state the probability of rejection in each tail, which should be as close as possible to 0.025

(3)

- (c) Find the actual level of significance of the test based on your critical region from part (b)

(1)

Rowan records that in the latest batch of 15 type *A* vacuum tubes exposed to alternating high and low temperatures, 4 of them shattered.

- (d) With reference to part (b), comment on Rowan's belief. Give a reason for your answer.

(1)

Rowan changes to type *B* vacuum tubes. He takes a random sample of 40 type *B* vacuum tubes and finds that 8 of them shatter when exposed to alternating high and low temperatures.

- (e) Test, at the 5% level of significance, whether or not there is evidence that the proportion of type *B* vacuum tubes that shatter when exposed to alternating high and low temperatures is lower than 35%  
You should state your hypotheses clearly.

5. The random variable  $W$  has a continuous uniform distribution over the interval  $[-6, a]$  where  $a$  is a constant.

Given that  $\text{Var}(W) = 27$

- (a) show that  $a = 12$

(2)

Given that  $P(W > b) = \frac{3}{5}$

- (b) (i) find the value of  $b$

(2)

(ii) find  $P\left(-12 < W < \frac{b}{2}\right)$

(2)

A piece of wood  $AB$  has length 160 cm. The wood is cut at random into 2 pieces. Each of the pieces is then cut in half. The four pieces are used to form the sides of a rectangle.

- (c) Calculate the probability that the area of the rectangle is greater than 975 cm<sup>2</sup>

P 7 4 3 2 2 A 0 1 9 2 8

6. A bag contains a large number of counters with an odd number or an even number written on each.

Odd and even numbered counters occur in the ratio  $4 : 1$

In a game a player takes a random sample of 4 counters from the bag.

The player scores

5 points for each counter taken that has an even number written on it

2 points for each counter taken that has an odd number written on it

The random variable  $X$  represents the total score, in points, from the 4 counters.

- (a) Find the sampling distribution of  $X$

(6)

A random sample of  $n$  sets of 4 counters is taken. The random variable  $Y$  represents the number of these  $n$  sets that have a total score of exactly 14

- (b) Calculate the minimum value of  $n$  such that  $P(Y \geq 1) > 0.95$
